- Background
- Rationale
- Casualty Statistic Comparisons
- Summary

# Background

---

Combat casualty statistics provide important information for use in the prevention, treatment, and estimation of casualties:

- The case fatality rate (CFR) which describes the casualties who have died among all wounded
- The percentage of casualties killed in action (%KIA) which describes immediate deaths among all seriously wounded.
- The percentage of casualties who died of wounds (%DOW) following admission to a medical facility among all seriously wounded.

# Rationale

- CFR provides a measure of the overall lethality of the battlefield
- %KIA can be indicative of the effectiveness of current body armor and lethality of various weapons
- %DOW can measure the effectiveness of combat casualty medical care

Why do we care?

# User Definitions

- KIA = Deaths before reaching Medical Treatment Facility (MTF)
- WIA = All battle casualties
  - Includes DOW and RTD\*
  - Does not include KIAs
- DOW = Those that die after reaching MTF

**WIA = WIA Not RTD < 72 hours + DOW + RTD < 72 Hours**

\*WIA RTDs are defined as those that are WIA but return to duty within 72 hours.

# Casualty Rate Formulas\*

$$\%KIA = \left[ \frac{KIA}{KIA + (WIA - RTD)} \right] \times 100$$

$$\%DOW = \left[ \frac{DOW}{(WIA - RTD)} \right] \times 100$$

$$CFR = \left[ \frac{KIA + DOW}{KIA + WIA} \right] \times 100$$

CFR reflects the overall lethality in all those who are wounded in conflict.

WIA = WIA Not RTD < 72 hours + DOW + RTD < 72 Hours

RTD = WIA casualties who RTD < 72 hours

# Comparison of USA and USMC WIA Casualties During OIF

# MAIN RESULTS

- CFRs have been declining since WWII
- Majority of all deaths are KIA
- CFRs among the USA and USMC are similar
- Although %DOW are similar, the CFRs and %KIA are significantly different between OEF and OIF
